Research Project Pages (RPP): Conducting your Research Investigation

The following pages provide documents to help you conduct your research investigation. Throughout this unit, you are addressing the question: "Why do some people become regular smokers and others do not?" by the carrying out these steps:

- Develop an overarching hypothesis from smoker profiles, your intuition/observations, and past research (Lessons 1-5).
- Create specific hypotheses that relate to your overarching hypothesis from the Smoking Behavior database questions (Lesson 6).
- Analyze many questions from the Smoking Behavior database to generate new hypotheses for future studies (Lesson 7).

The above bullet points are broken down into the following sections of RPP:

RPP-1
Lesson 2. Research Topic and Overarching HypothesisRPP-2-3
Lesson 3. Genetic Component to Research TopicRPP-4
Lesson 4. The Smoking Behavior Case Control StudyRPP-5-6
Lesson 6a. Hypothesis TestingRPP-7-10
Lesson 6b. Mapping ActivityRPP-11
Lesson 6c. Drawing ConclusionsRPP-12
Lesson 7a. Planning your Hypothesis Generation ResearchRPP-13
Lesson 7b. Conducting Queries in Hypothesis Generation
Lesson 7c. Hypothesis Generation and Proposing a New Case Control Study RPP-15-17

Lesson 4. The Smoking Behavior Case Control Study, continued

Questions:

1. The Smoking Behavior Study was conducted in the urban Puget Sound Region through the University of Washington. Why do you think there might have been problems properly matching cases and controls?

There may have been problems matching the cases of controls because of the different recornes present to different races, ethnicity, and age groups.

Not only that but those who him different ethnicitation of people so its difficult trying to get an overfall picture of what going on. Sometimes that people so its difficult trying to get an overfall picture of what going on. Sometimes that the problems matching cases and controls (as far as gender, age, and racial group) affect the results of your investigation? Refer to your specific exposure(s). However, as sometimes trying to match cases of controls for gender is

to matan cases & controls for gender is
that women may not really have taken a
liking to smoking as much as men probably
because most of them are busy at nome while
the husbands have more time those who are
eases probabably are able to stick with it
they have the same vation so gender is
a factor. As, for age, the order people probably
have more resources & expenience at
getting it at a cheeper price. Raeial
groups vare been treated unfairy

Designing your proposed case control study:
5. Formulate a new hypothesis for your proposed case control study. What evidence did you use from your Hypothesis Generation queries to form this hypothesis? If a person feels a reduction from stress of feels a reduction from stress of feels as more than the proposed case control study. What evidence did you use from your Hypothesis Generation queries to form this hypothesis?
Note: It does not need to be the same as the outcome for this study. For example, you may be interested in designing a study focused on smoking cessation.
Why did you choose this outcome? stress affects make someone more likely to smoke we chose this ble we band
avery strong to 2 significant findi
7. Describe up to four exposures you would study related to your research topic and explain why you are interested in each exposure. a. Amount of work that they deal with maybe b. other types of dougs used be cause this can their makes a person relaxed from their don't reed to smoke. C. food can affect now one responses to smoking d. Amount of exercitie, those who taken a serior to smoking. M. have le stores than these who taken a serior to smoking.
8. In your proposed case control study, what are the characteristics of your study population? Note: your study population can be different from the population in the original Smoking Behavior study. For example, you may want to study males only, or people from a certain race/ethnicity or age bracket.
Males
Why did you choose this study population? Because there was a strong moreing correlation between men, smoking
